

Carabiners and Pumpjack Safety

The carabiner used here is an automatic locking gate which allows operation even with winter gloves. These are 5000 Lb rated and meet CSA Z259.1 and are used as a fall restraint as opposed to fall arrest .

Some electrical work is located on the walking beam which does not allow an individual to tie off over head. As well as, two hands are much easier for this type of work. Utilizing the type of restraint allows the worker to use both hands and maintain 3 point contact.

Carabiners can be used as a solution for customized needs for access and height safety. They are designed for installation on fixed, permanent ladders of virtually any height. Using carabiners allows the worker to always maintain 3 points of contact with the ladder at all times.
